NAME

ElementalAnalysisTextFiles.pl - Perform elemental analysis using formula column in TextFile(s)

## SYNOPSIS

ElementalAnalysisTextFiles.pl TextFile(s)...

```
ElementalAnalysisTextFiles.pl [-c, --colmode colnum | collabel] [-d, --detail infolevel] [-f, --fast]
--formulacol colnum | collabel] [-h, --help] [--indelim comma | semicolon] [-m, --mode All | "ElementalAnalysis,
[MolecularWeight, ExactMass]" ] [-o, --overwrite] [--outdelim comma | tab | semicolon] [-p, --precision
number] [-q, --quote yes | no] [-r, --root rootname] [-s, --startcol colnum | collabel] [-startcolmode before |
after] -v --valuecollabels [Name, Label, [Name, Label,...]] [-w, --workingdir dirname] TextFile(s)...
```

## DESCRIPTION

Perform elemental analysis using molecular formula column specified by a column number or label in *TextFile(s)*.

In addition to straightforward molecular formulas - H<sub>2</sub>O, HCl, C<sub>3</sub>H<sub>7</sub>O<sub>2</sub>N - other supported variations are: Ca<sub>3</sub>(PO<sub>4</sub>)<sub>2</sub>, [PCl<sub>4</sub>]<sub>+</sub>, [Fe(CN)<sub>6</sub>]<sub>4-</sub>, C<sub>37</sub>H<sub>42</sub>N<sub>2</sub>O<sub>6</sub><sub>+2</sub>, Na<sub>2</sub>CO<sub>3</sub>.10H<sub>2</sub>O, 8H<sub>2</sub>S.46H<sub>2</sub>O, and so on. Charges are simply ignored. Isotope symbols in formulas specification, including D and T, are not supported.

The valid file extensions are .csv and .tsv for comma/semicolon and tab delimited text files respectively. All other file names are ignored. All the text files in a current directory can be specified by \*.csv, \*.tsv, or the current directory name. The --indelim option determines the format of *TextFile(s)*. Any file which doesn't correspond to the format indicated by --indelim option is ignored.

## OPTIONS

-c, --colmode *colnum* / *collabel*

Specify how columns are identified in *TextFile(s)*: using column number or column label. Possible values: *colnum* or *collabel*. Default value: *colnum*.

-d, --detail *infolevel*

Level of information to print about lines being ignored. Default: 1. Possible values: 1, 2 or 3.

-h, --help

Print this help message.

--fast

In this mode, the formula column specified using -f, --formulacol option is assumed to contain valid molecular formula data and initial formula validation check is skipped.

-f, --formulacol *col number* / *col name*

This value is mode specific. It specifies molecular formula column to use for performing elemental analysis on *TextFile(s)*. Possible values: *col number* or *col label*. Default value: *first column containing the word formula in its column label*.

-m, --mode All | "ElementalAnalysis,[MolecularWeight,ExactMass]"

Specify what values to calculate using molecular formula in *TextFile(s)*: calculate all supported values or specify a comma delimited list of values. Possible values: All | "ElementalAnalysis, [MolecularWeight, ExactMass]". Default: All

--indelim *comma* / *semicolon*

Input delimiter for CSV *TextFile(s)*. Possible values: *comma* or *semicolon*. Default value: *comma*. For TSV files, this option is ignored and *tab* is used as a delimiter.

-o, --overwrite

Overwrite existing files.

--outdelim *comma* / *tab* / *semicolon*

Output text file delimiter. Possible values: *comma*, *tab*, or *semicolon* Default value: *comma*.

-p, --precision *number*

Precision of calculated values in the output file. Default: up to 2 decimal places. Valid values: positive

**-q, --quinteeses / no**

Put quotes around column values in output text file. Possible values: *yes* or *no*. Default value: *yes*.

**-r, --root rootname**

New text file name is generated using the root: <Root>.<Ext>. Default new file name: <InitialTextFileName>ElementalAnalysis.<Ext>. The csv, and tsv <Ext> values are used for comma/semicolon, and tab delimited text files respectively. This option is ignored for multiple input files.

**-s, --startcol column | collabel**

This value is mode specific. It specifies the column in text files which is used for start adding calculated column values. For *column* mode, specify column number and for *collabel* mode, specify column label.

Default value: *last*. Start merge after the last column.

**--startcolmode before | after**

Start adding calculated column values after the -s, --startcol value. Possible values: *before* or *after*. Default value: *after*.

**-v --valuecollabels Name,Label,[Name,Label,...]**

Specify column labels to use for calculated values. In general, it's a comma delimited list of value name and column label pairs. Supported value names: *ElementalAnalysis*, *MolecularWeight*, and *ExactMass*. Default labels: *ElementalAnalysis*, *MolecularWeight*, and *ExactMass*.

**-w, --workingdir dirname**

Location of working directory. Default: current directory.

## EXAMPLES

To perform elemental analysis, calculate molecular weight and exact mass using formulas in a column with the word Formula in its column label and generate a new CSV text file NewSample1.csv, type:

```
% ElementalAnalysisTextFiles.pl -o -r NewSample1 Sample1.csv
```

To perform elemental analysis using formulas in column number two, use column label Analysis for calculated data, and generate a new CSV text file NewSample1.csv, type:

```
% ElementalAnalysisTextFiles.pl --m ElementalAnalysis --formulacol 2
--valuecollabels "ElementalAnalysis,Analysis" -o -r NewSample1
Sample1.csv
```

To calculate molecular weight using formula in column label Formula with four decimal precision and generate a new CSV text file NewSample1.csv, type

```
% ElementalAnalysisTextFiles.pl --m MolecularWeight --colmode collabel
--formulacol Formula --precision 4 -o -r NewSample1 Sample1.csv
```

To calculate exact mass using formula in column label Formula with four decimal precision, adding column for exact mass right after Formula column, and generate a new CSV text file NewSample1.csv, type

```
% ElementalAnalysisTextFiles.pl --m ExactMass --colmode collabel
--formulacol Formula --precision 4 --startcolmode after
--startcol Formula -o -r NewSample1 Sample1.csv
```
